

MANGOi · STUDENT LEARNING GAME

Avatar Quest LIVE

A companion that grows every time the student studies

3 August 2026 · Our 13th student game · Already available to students

Every speaking or vocabulary mission makes the student's companion grow, and at set points a short cinematic evolution plays. Yesterday's effort is still on the screen today — that is what gives the student a reason to come back.

1. Actual screens

1. Choose a companion
Panda, fox, dragon or dog

2. My companion
Growth bar, energy, today's missions

3. Speaking mission

Read the sentence aloud to be scored

Phone portrait view. Every label appears in both Korean and English.

Turn the phone sideways and the screen splits left and right — children often play games in landscape.

2. What the student does

STEP 1

Choose

Pick one of four. It starts as an egg.

STEP 2

Do missions

Speak aloud · match meaning · word order · listen & choose

STEP 3

Evolve

The egg hatches and a 3-second cinematic plays at each stage.

STEP 4

Weekly boss

Once a week, a 90-second challenge opens.

NOTE

Why does “evolution” matter? Children respond far more strongly to a **visible change** than to a rising number. A score alone gets boring; a changing shape creates a reason to come back — “I want to see the next form.”

3. The companions

Everyone starts from an **egg**. Each egg carries a mark so you can tell what will hatch.

From left: panda (chef hat) · fox (stars) · dragon (scales and horns) · dog (cape band and star)

Missions make it grow. There are **4 species × 5 stages = 20 forms**.

Each stage adds size and equipment

4. Why this one is different

	Our other 12 games	Avatar Quest
Shape	One session and done	Continuous — yesterday's result is still there
Reason to return	Only if it was fun	Their companion is waiting

NOTE

Retention is the whole point of this game. The other games are fun, but they do not create a reason to log in *today*. The companion gets sleepy when the student stays away, and greets them when they return.

5. What works, what does not

Item	Status	Detail
4 species · 5 growth stages	Done	All 20 forms ready
Evolution cinematics	Done	16 clips (every evolution)
4 missions · weekly boss	Done	
Score carries across devices	Done	Stored on the server
Chosen species carries across devices	Not yet	The score carries over, but which companion they picked is stored on that device only . Changing phones means choosing again (the screen says so).

NOTE

Why is only this one missing? It needs new storage and a new route on the server, and that work touches a core file every part of the service passes through. A mistake there could stop video classes and payments, so by our own rule **only one designated maintainer** may edit it. The screen

side is already prepared, so it will connect as soon as that route exists. **Students are not affected in the meantime.**

6. Safety checks

PRIVACY No student's real name appears on the ranking. Only the nickname the student chose is shown, and if they have not chosen one, nothing is shown at all.

(A place where the real name would have been sent was found and fixed during development. Data was checked: **zero students** were actually exposed.)

NUMBERS Every figure on screen is a **real record**. If the server cannot be reached, the game does not invent a plausible number — it says "could not load right now". Students who are not logged in always see "Guest mode — not saved".

CHILD SAFETY The companion **never dies or disappears**, and points are never taken away for being absent. It only looks sleepy, and one mission restores it. We deliberately avoided "study or your character dies" pressure.

SPEAKING Saying "I have a **cat**" for "I have a dog" does **not** pass. A slightly shaky pronunciation does pass. We catch mistakes that change the meaning, not the child's accent.

7. How to see it

Where	Student screen → Student Games → Avatar Quest (second card)
Recommended	View it on a phone. Landscape works too.
If it looks old	Open the browser in private / incognito mode.

8. Cost

Art and video	About 130 credits (17 AI videos + 24 images + 20 background removals)
Extra server cost	None — built by reusing what already existed
Student data use	About 0.3MB per clip, downloaded only when needed

NOTE

The evolution clips are **pre-made files**. We do not call an AI each time a student evolves, so there is **no recurring cost**. Originals were 3–4MB each; we compressed them to **one eighth** of that, to a point where the difference is invisible on a phone. This was done with slower connections in the Philippines in mind.

9. Glossary

EXP

The score that makes the companion grow. It is **the student's saved coin total** on MANGOi, including coins earned in other games.

Evolution cinematic

The 3-second clip that plays when a stage is reached.

Deploy

Publishing a change to the live service, then checking the real address to confirm it is fine.

Guest mode

Not logged in. Playable, but nothing is saved — and the screen always says so.

10. Next

- Watch how often students actually return, then tune missions and rewards.
- Making the chosen species carry across devices needs the designated maintainer.
- Showing the companion in the parent report and teacher screens is written up in a separate review note.

Contact — for questions about the game or its screens, please contact the **development lead**.

The “not yet” item in section 5 needs the **maintainer who holds server deploy rights**.
