1. Why This Manual Exists

Most Mangoi students are children and teenagers. For this age group, it is not simply “if it is not fun, they will not learn” — it is closer to “if it is not fun, they will not even pay attention in the first place.” Online classes make this harder: they convey 30–40% less emotion and energy than in-person teaching, so unless the teacher deliberately designs for engagement, a child can check out within five minutes.

That is why engagement (the class is fun) and achievement (the child improves) are not separate goals. Children grow in this order: “it is fun → so they keep going → and because they keep going → they improve.” This manual helps teachers create that virtuous cycle inside every single class, and helps managers train teachers in that direction.

The manual covers (1) the five core focus areas for engaging kids, (2) the Mangoi Engagement Cycle built on our platform features, (3) the teacher training roadmap, and (4) age-specific tips — with a class checklist and a teacher evaluation rubric provided as appendices.

“We are not teaching children English — we are giving them time to play in English.” — Mangoi teaching philosophy

2. The Five Core Focus Areas for Engaging Kids

1. Energy & Facial Expression (Reaching Through the Screen)

Why it matters: Video conveys less emotion. If a teacher performs at a “normal” level, it arrives as “boring” to the child. Exaggerated energy is what registers as “just right” on the other side of the screen.

Do this: Make non-verbal reactions a habit — thumbs-up, clapping, surprised faces — and praise correct answers instantly and loudly (“Wow! Amazing!”). Raise your vocal tone one notch above normal.

Avoid this: A blank face, a monotone voice, or eyes fixed down on the keyboard. If the teacher looks bored, the child becomes bored too.

2. Student Talk Time (Cut Teacher Talk Time)

Why it matters: The #1 mistake of new teachers is talking too much. The person doing the talking is the person doing the learning. The child has to open their mouth to improve — and to stay engaged.

Do this: Target 60%+ student talk time. Ask a question → wait 3 seconds → let the child speak. Keep explanations short, model once, and let the child do the rest.

Avoid this: Saying the answer before the child does, jumping in before the 3-second think time is up, or delivering long grammar lectures.

3. Making Small Wins Visible — Instantly

Why it matters: Children keep going only when they get a signal that says “I am doing well.” Visible rewards and progress are far more powerful than abstract encouragement.

Do this: Actively use Mangoi’s star ratings, badges, confetti, and the Mango mascot reactions during class (“Get this right and Mango will dance!”). Set one small goal each class and confirm it together when achieved.

Avoid this: Glossing over wins with a vague “good job,” or pointing out only mistakes while letting the good moments pass unnoticed.

4. Personalization (Name, Interests, Level)

Why it matters: Children engage when it feels like “a class made for me.” Simply using their name noticeably raises attention.

Do this: Use the child’s name often and bring in what they love (games, K-pop, soccer) as conversation topics. Use Mangoi’s textbook-linked AI warm-up and mistake personalization to know their frequent errors before class.

Avoid this: Running the same script for every child, never asking about their interests, or ignoring last class’s mistakes.

5. Rhythm & Transitions (Blocking Boredom)

Why it matters: A child’s attention span is roughly ‘age = minutes’ (an 8-year-old ≈ 8 minutes). Any single activity that runs long will sag.

Do this: Break and switch activities every 5–7 minutes. Give it rhythm — ‘textbook → game → speaking → game’ — and place Mangoi game-tab activities (shooter, 3D battle, vocab games) between segments.

Avoid this: Dragging one activity past 15 minutes, or plowing ahead with the lesson while ignoring signs of fatigue (fidgeting, yawning).

3. The Mangoi Engagement Cycle

The features are already built. The key is for the teacher to weave them together naturally as ‘tools of fun’ and run them as one cycle. Train this cycle into muscle memory and an entire class becomes an engagement structure.

Warm-up (Textbook AI) → Set a Mission → Speaking Activity → Game Reward → Instant Feedback (stars·mascot) → Next Mission

Stage	Mangoi Feature	What the Teacher Does
① Warm-up	Textbook-linked AI warm-up + mistake personalization	Loosen them up with light questions and naturally review last class’s mistakes.
② Set a mission	Goal-of-the-day card	Declare one small, clear goal, e.g. “Today, master 3 new words!”
③ Speaking activity	Textbook + screen share	Keep explanations short; drive 60%+ student talk (ask → wait → speak).
④ Game reward	Student game hub (shooter·3D battle·vocab·Chinese)	Place games between segments for rhythm and to repeat target expressions.
⑤ Instant feedback	Star ratings·badges·confetti·Mango mascot	Celebrate the win visibly (“Mango is dancing!”) and name exactly what was good.
⑥ Next mission	Game learning analytics·teacher report	Feed mistake and pronunciation data into the next class’s personalization.

4. Teacher Training Roadmap

A. Required Onboarding Training (At Hire)

Items every new teacher must pass before their first real class.

- Watch demo classes: view 3–5 recordings of top teachers, then write down 3 things that made the child laugh.
- Mock class (role-play): a trainer plays a ‘distracted 8-year-old’ while the teacher practices reactions, transitions, and re-focusing.
- Platform proficiency test: verify the teacher can run the game tab, 3D battle, star ratings, and screen share smoothly (half of engagement comes from smooth operation).

B. Continuous Training (In Operation)

Skill grows from repeated feedback, not from onboarding alone.

- Monthly peer review: teachers share class recordings and give each other 1 strength + 1 improvement.
- Best-clip sharing: collect “that reaction was great” moments in a team channel to spread good practice.
- Data-driven 1:1 coaching: pull each teacher’s star ratings, game analytics, and churn-risk graph, and give low-engagement teachers concrete fixes.

C. Linking Evaluation & Rewards

A “do well → gain” structure is what creates voluntary quality competition.

- Teacher KPI = a blend of student star ratings + re-enrollment rate + game/class participation.
- Motivate with incentives for top teachers and ‘excellent teacher’ badges.
- Route low performers to coaching, not punishment (diagnose the cause with data).

5. Age-Specific Teaching Tips

Even the same ‘fun’ works differently by age. Below is a quick-reference summary.

Age	Attention Span	Key Tips
5–7 (early)	~5–7 min	Songs, movement, puppets, exaggerated faces. Simple-rule games. Praise instantly and loudly. Sound and pictures over letters.
8–10 (lower elem.)	~8–10 min	Respond strongly to missions, rewards, badges. Repeat short game rounds. Use the ‘joy of winning’ (3D battle, shooter).
11–13 (upper elem.)	~12–15 min	Start responding to ‘why am I learning this.’ Peer comparison, rankings, progress graphs work well. Connect to interests (games, K-pop).
14+ (teens)	~15–20 min	Feeling respected matters. Motivate via exams and real-life relevance. Overly childish theatrics backfire — win with visible achievement.

Appendix A. Class Checklist

For teachers to self-check every class. Print it and keep it beside you.

Before Class (2 min)

- ☐ I reviewed the child's name, last class's mistakes, and interests.
- ☐ I set one small goal for today.
- ☐ I pre-tested that the game tab, textbook, and screen share work.
- ☐ I checked lighting, camera angle, and that my face looks bright.

During Class

- ☐ I made the child laugh within the first 30 seconds.
- ☐ The child is talking more than I am (60%+).
- ☐ I waited 3 seconds after questions (I did not say the answer first).
- ☐ I switched activities within 5–7 minutes.
- ☐ I called the child by name multiple times.
- ☐ I praised wins instantly and specifically, and made them visible with stars/mascot.

After Class (2 min)

- ☐ I recorded star ratings and game results.
- ☐ I saved mistake/pronunciation data for the next class.
- ☐ I noted one idea for this child's next class.

Appendix B. Teacher Evaluation Rubric

A 6-item scale for managers/trainers during class observation or video review. Score each item 1–3, sum, and set coaching priority.

Criterion	1 – Needs Work	2 – Adequate	3 – Excellent
Energy & expression	Blank face, monotone, few reactions	Adequately bright but inconsistent	Energy clearly reaches through the screen; child laughs often
Driving student talk	Teacher does most talking (excess TTT)	About half student talk	Student talk 60%+; skilled ask→wait→speak
Making wins visible	Little praise or reward	Praises, but vaguely	Celebrates wins concretely and instantly with stars/badges/mascot
Personalization	Same script for everyone	Uses at least the name	Adapts to interests and mistakes for a made-for-me class
Rhythm & transitions	One activity dragged out; sags	Transitions exist but a bit late	5–7 min rhythm and game placement keep engagement to the end
Platform use	Barely uses features; stumbles	Uses basic features	Blends games, battle, and ratings smoothly into the class

* Total 15–18: excellent teacher (mentor/best-clip candidate) / 10–14: solid (partial coaching) / 9 or below: intensive coaching.
